Understanding Your Results

Thyroid Health

Your Thyroid Health results show that your thyroid stimulating hormone (TSH), free tri-iodothyronine (FT3) and free thyroxine (FT4), all important tests of thyroid function, are optimal. Furthermore, your results indicate that you do not have anti-thyroglobulin and anti-thyroid peroxidase antibodies, which are a common cause of thyroid disease.

Thyroid Health

The thyroid gland plays an important role in controlling the body's metabolism by producing hormones. Thyroid hormones help the body to use energy, stay warm and keep the heart, brain, muscle and other organs functioning properly. Thyroid Health consists of tests that can be used to help diagnose an 'underactive thyroid' (hypothyroidism) or an 'overactive thyroid' (hyperthyroidism), or to monitor the treatment of these conditions.

Thyroid Stimulating Hormone (TSH)

2.77
mIU/l

Free Thyroxine (FT4)

19.7
pmol/l

Free Tri-iodothyronine (FT3)

4.52
pmol/l

Anti-Thyroglobulin Antibody (Anti-Tg)

18
IU/ml

Anti-Thyroid Peroxidase Antibody (Anti-TPO)

13
kU/l

Test Glossary

Anti-Thyroglobulin Antibody (Anti-Tg)

Anti-Thyroglobulin Antibody (Anti-Tg) is a protein produced by the immune system that attacks thyroglobulin (a precursor of thyroid hormones). Elevated anti-Tg levels are associated with Hashimoto's thyroiditis, an autoimmune condition that causes hypothyroidism (an underactive thyroid gland) and Graves' disease, an autoimmune condition that causes hyperthyroidism (an overactive thyroid gland).

Anti-Thyroid Peroxidase Antibody (Anti-TPO)

Anti-Thyroid Peroxidase Antibody (Anti-TPO) is a protein produced by the immune system that attacks thyroid peroxidase (an enzyme found in the thyroid gland). Elevated anti-TPO levels are associated with Hashimoto's thyroiditis, an autoimmune condition that causes hypothyroidism (an underactive thyroid gland) and Graves' disease, an autoimmune condition that causes hyperthyroidism (an overactive thyroid gland).

Free Thyroxine (FT4)

Free Thyroxine (FT4) is a hormone produced by the thyroid gland that is involved in regulation of the body's metabolism. Free thyroxine is a measure of the amount of active thyroxine circulating in the bloodstream and helps evaluate thyroid function. Elevated FT4 levels are associated with hyperthyroidism (an overactive thyroid gland), whilst decreased FT4 levels are associated with hypothyroidism (an underactive thyroid gland).

Free Tri-iodothyronine (FT3)

Free Tri-iodothyronine (FT3) is a hormone produced by the thyroid gland that is involved in regulating the body's metabolism. Free Tri-iodothyronine is a measure of the amount of active tri-iodothyronine circulating in the blood and helps evaluate thyroid function. Elevated FT3 levels are associated with hyperthyroidism (an overactive thyroid gland), whilst decreased FT3 levels are associated with hypothyroidism (an underactive thyroid gland).

Thyroid Stimulating Hormone (TSH)

Thyroid Stimulating Hormone (TSH), produced by the pituitary gland in the brain, acts on the thyroid gland to regulate thyroid hormone production and release. Thyroid stimulating hormone levels are subject to feedback control, thus when the concentration of thyroid hormones in the blood rise, TSH production decreases. Conversely, when thyroid hormone concentrations are low, the pituitary gland produces more TSH. A high level of TSH in the blood suggests that the thyroid gland is underactive, a condition known as hypothyroidism. Low TSH levels are associated with hyperthyroidism (an overactive thyroid gland) and hypopituitarism (a rare condition in which the pituitary gland is underactive).
