Male Hormones Results Report

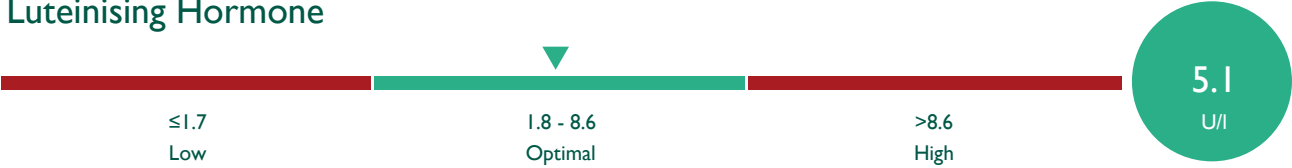

Dear Anees Mohammed,

Please find enclosed your Male Hormones results.

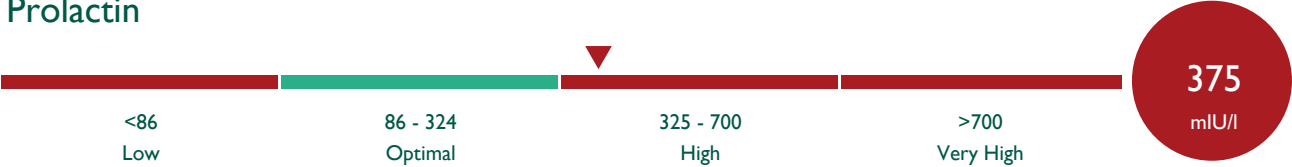

Follicle Stimulating Hormone

Luteinising Hormone

Prolactin

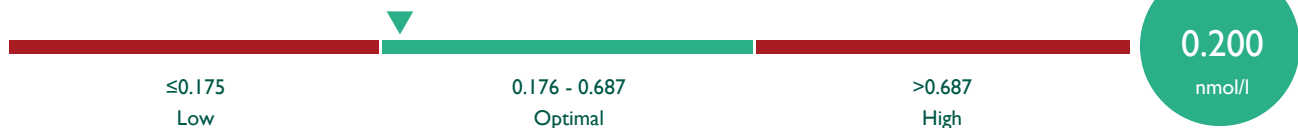

Testosterone

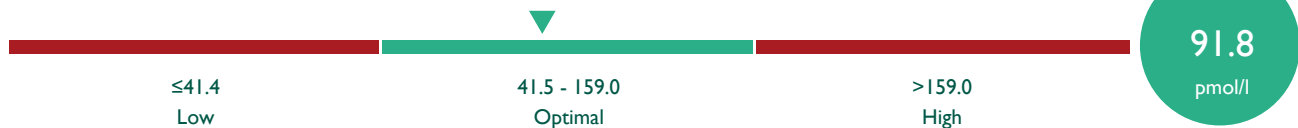

Sex Hormone Binding Globulin

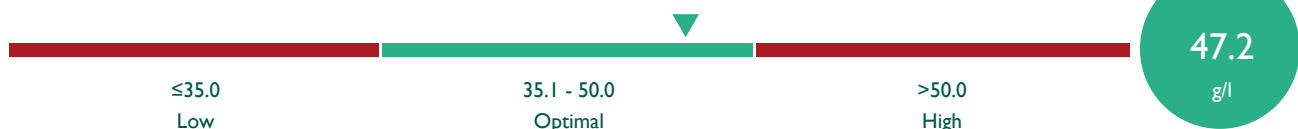

Free Testosterone

Oestradiol

Albumin

Understanding your Results - Follicle Stimulating Hormone & Luteinising Hormone

Follicle stimulating hormone (FSH) and luteinising hormone (LH) are hormones produced by the pituitary gland in the brain. In men, FSH promotes testicular growth and production of mature sperm, and LH stimulates testosterone production. Your results indicate that your FSH and LH levels are optimal.

Understanding your Results - Prolactin

Prolactin is a hormone produced by the pituitary gland in the brain. Prolactin supports breast milk production during pregnancy; therefore, levels in men are usually low. High levels can occur with prolactinoma, an often benign, prolactin-secreting growth of the pituitary gland; however, this is more common in women than men. In addition, stress, exercise and some medications, including some treatments for high blood pressure, depression and acid reflux, can cause high prolactin. We recommend that you discuss this result with a doctor.

Understanding your Results - Testosterone, Sex Hormone Binding Globulin & Free Testosterone

Testosterone is a key male sex hormone. It is essential for the development of male reproductive organs and helps to maintain sexual function, reproductive function and muscle mass. Testosterone circulates in the bloodstream bound to sex hormone binding globulin (SHBG) and albumin; however, only free testosterone is used by the body. A low free testosterone can lead to loss of libido, erectile dysfunction and problems with fertility. Your results show high SHBG, while your testosterone and free testosterone are optimal. SHBG levels gradually increase with age. Furthermore, higher than normal SHBG levels can occur with hyperthyroidism (an overactive thyroid) and liver disease. An excess of SHBG can reduce the amount of testosterone available for use by the body; however, your testosterone and free testosterone results indicate normal testosterone availability.

Understanding your Results - Oestradiol

Oestradiol is the main form of oestrogen found in the body. It is primarily produced by the ovaries and promotes growth of the uterus, vagina, fallopian tubes and breasts in women. In men, the testes, adrenal glands and peripheral fat tissue also produce oestradiol but in much smaller amounts. Elevated levels of oestradiol in men may be associated with signs of feminisation, such as gynaecomastia (enlargement of the male breast), oestrogen-producing tumours, liver disease and obesity. Your results show your oestradiol is optimal.

Understanding your Results - Albumin

Albumin is the major protein type found in the blood. Changes to albumin levels may affect the amount of testosterone that is free and available for the body to use. Your results show your albumin level is optimal.
